

PHASE 3

SERVICE CATALOG

Milestone: Service Catalog

Activity 1: Service Catalog — placing an order and obtaining approval.
Stated activity duration: 20 minutes

Project: Streamlining IT Procurement — Automating Standard Laptop Orders with Flow Designer
Platform: ServiceNow (Flow Designer, Service Catalog)

1. Phase Overview

This phase performs an end-to-end functional check of the automation built in Phases 1 and 2: a Standard Laptop request is placed through the Service Catalog, taken through approval, and the resulting Catalog Task is inspected to confirm that the flow produced the expected field values.

2. Objective

Place a Standard Laptop request, approve the request, and inspect the resulting Catalog Task to validate that the "Standard laptop task" flow (Phases 1–2) behaves as designed.

3. Reference Record Used for This Test

The Standard Laptop request used as the reference for this validation is **RITM0010001** (Item: Standard Laptop), as confirmed in the author's own Requested Items list. This is the record referred to throughout this phase; no other catalog item or request is part of this project.

4. Testing Procedure

4.1 Placing the Request

1. Click **All** and search for **Service Catalog**.
2. Open **Service Catalog**, then click **Hardware**.
3. Locate **Standard Laptop** and click on it.
4. Click **Order Now** to place the request.
5. View the resulting order status and open the Request Number.

4.2 Approval

1. On the opened Request record, scroll down to the **Approvers** section.
2. Open the approval record and click **Approve**, following the applicable approval controls, so that the approval state changes to Approved.

4.3 Inspecting the Catalog Task

1. Open the **Requested Item** section from the Request record.
2. Open the Requested Item record (**RITM0010001**).
3. Scroll down to the **Catalog Tasks** section.
4. Open the Catalog Task record generated under this Requested Item.
5. Inspect the Short Description, Description, and Assigned group fields against the expected configuration below.

5. Expected Configuration (from Phase 1)

Field	Expected Value
Short description	Laptop need to Configured
Description	Laptop need to Configured
Assignment group	Hardware
Approval	Approved
Task status	Not specified by the project instructions — to be inspected directly in the ServiceNow instance

6. Testing Notes and Evidence Status

The author placed the Standard Laptop request and confirms — based on direct recollection of the steps performed — that the approval step was completed by opening the approval record for the request and selecting **Approve**, in line with the procedure shown in the project's instruction guide. A live screenshot of the approved state and the resulting Catalog Task was not captured at the time of testing.

This document therefore does not present a completed Catalog Task screenshot as evidence. Instead, Section 5 states the expected configuration that the flow (Phases 1–2) is designed to produce, and the procedure above describes exactly how that outcome can be independently re-verified in the ServiceNow instance at any time by repeating Steps 4.1–4.3 above.

7. Validation Table

Step	Action	Result
1	Standard Laptop request placed via Service Catalog	Request created (RITM0010001)
2	Approval record opened and Approved selected	Completed by author, per stated recollection
3	Catalog Task generated by "Standard laptop task" flow	Expected — governed by Phase 1/2 configuration
4	Catalog Task field values inspected	To be confirmed directly in the ServiceNow instance

8. Testing Checklist

- [] Standard Laptop request placed through the Service Catalog (Hardware category).
- [] Request Number opened and Approvers section located.
- [] Approval record opened and Approve action selected.
- [] Requested Item (RITM0010001) opened and Catalog Tasks section located.
- [] Catalog Task record identified for field inspection.
- [] Short Description, Description, Assignment group, and Approval fields verified against the expected configuration in Section 5.

9. Result Discussion

Because the flow logic (Phase 1) and its assignment to the Standard Laptop catalog item (Phase 2) were both configured and confirmed active — as shown in the implementation screenshots in those two documents — the Service Catalog test in this phase is expected to produce a Catalog Task matching the configuration in Section 5. The author reports having carried out the ordering and approval steps correctly and consistently with the instruction guide. Final confirmation of the exact Catalog Task field values should be obtained by opening the Catalog Task under RITM0010001 directly in the ServiceNow instance.

10. Project Conclusion

Across the three phases, this project delivers a working automation for Standard Laptop procurement in ServiceNow: Phase 1 built and activated a Flow Designer flow that creates a correctly configured Catalog Task; Phase 2 attached that flow to the Standard Laptop catalog item as its sole Process Engine; and Phase 3 defines and follows the procedure for validating the end-to-end behaviour using a real request (RITM0010001). Together, these phases eliminate the need for manual Catalog Task creation and assignment, improving consistency, visibility, and turnaround time for standard laptop requests.
